

ABSTRACT

A mobile telephone with a camera. A shutter of the camera can be remote controlled without using any device other than the mobile telephone body. The mobile telephone with a camera also includes a camera control unit, a voice recognition unit for recognizing a voice from a transmitter, a preliminarily registered voice sample, and a voice comparison unit for comparing an output of the voice recognition unit with one of the preliminarily registered voice samples in the voice sample. When the mobile telephone with the camera is in a camera mode, the voice comparison unit detects a coincidence of the output of the voice recognition unit and the voice sample and outputs a signal for operating a shutter of a camera to the camera control unit.
